Communication Techniques

- Identify yourself and address the person by name, establish and maintain eye contact, smile, and be friendly in your approach.
- Ask one question, or make one statement at a time, speaking slowly and directly.
- Allow enough time for the person to respond.
- Use nonverbal communication such as pointing or nodding, providing assistance when needed.
- Be patient, flexible and reassuring rather than criticizing, arguing or correcting the person.
- Focus on feelings, not facts, by responding to and validating the person's feelings.
- Use familiar words and cues, and be consistent, repeating information or questions as needed.

Tips for Reducing Risk

As we learn more about the role they may play in Alzheimer's disease risk, health experts encourage all adults to:

- exercise regularly
- eat a healthy diet rich in fruits and vegetables
- engage in social and intellectually stimulating activities
- control type 2 diabetes
- lower high blood pressure levels
- lower high blood cholesterol levels
- maintain a healthy weight
- stop smoking
- get treatment for depression

National Institute on Aging, National Institutes of Health, U.S. Department of Health and Human Services

Caregiver Tips

- Recognize added stress in your life and take care of your own health care needs.
- Realize it is OKAY to ask for help from a friend, so accept help when offered.
- Take a day off when you can and do something fun for yourself.
- Share and express your feelings with someone.
- Remove yourself from the situation when possible.
- Join a caregiver support group.
- Remember, you are not in this alone.

Caregiving is a difficult job in the best of circumstances. Taking care of yourself is essential for your own health and the care of your loved one.

Getting Help

Where to Go for an Evaluation:

Family physician, local hospital, teaching hospitals or medical schools, Geriatricians or Neurologists

There is no single diagnostic test for Alzheimer's disease. A diagnosis is made by ruling out other possible causes of Alzheimer-like symptoms. Once all tests are completed, a diagnosis of "probable" Alzheimer's disease may be made.

**Please note: Changes in diagnostic language utilized in the DSM-V refer to dementia as major and minor neurocognitive disorders. Healthcare professionals may use this terminology.*

What to Expect During an Evaluation

The entire evaluation process generally takes more than one day. Typically, a thorough evaluation may include:

- Detailed medical & social history
- Physical examination
- Neurological examination
- Mental status examination
- Psychiatric evaluation
- Laboratory tests
- CT, MRI and/or PET scans
